

AI Usage Note

InfraGuard : Agentic AI Powered Infrastructure Inventory Reconciliation System

What AI Helped With:

AI tools were used primarily as a support tool during project development. The core project design, implementation, testing, and integration were carried out by the team members.

AI was used for:

- Identifying and rectifying coding errors.
- Debugging API and backend issues.
- Suggesting code improvements and optimizations.
- Verifying logic and implementation approaches.
- Checking syntax errors and resolving dependency-related issues.

What AI Got Wrong:

Some AI-generated suggestions required manual verification and correction.

- Certain debugging suggestions were not applicable to the project environment.
- Some code corrections introduced dependency or compatibility issues.
- AI occasionally misinterpreted project requirements and suggested generic solutions.
- Generated fixes required testing before adoption.

Therefore, all AI-generated outputs were reviewed and validated by the project team before implementation.

Best Prompts Used:

- Identify and fix errors in this FastAPI code.
- Review this Python function and suggest improvements.
- Find possible issues in this API implementation.
- Explain the cause of this error message and provide a solution.
- Check this project documentation for technical accuracy and clarity.
- Suggest optimizations for this backend workflow without changing functionality.

Declaration:

AI was used only as a support tool for debugging, error correction and code review. The project architecture, implementation, testing, and final decisions were completed by the development team.
